LivingDoc

Frontend Pack

The Self-Updating Business Brain. Screenshots of the working interface, each with a caption: what you see, and why it is built that way.

Aaditya Sheth | Institute of Technology, Nirma University

Code: https://github.com/pt-scheon/livingdoc (frontend/ folder, README for setup)

All screenshots were taken from the running app with sample data.

How to read this pack

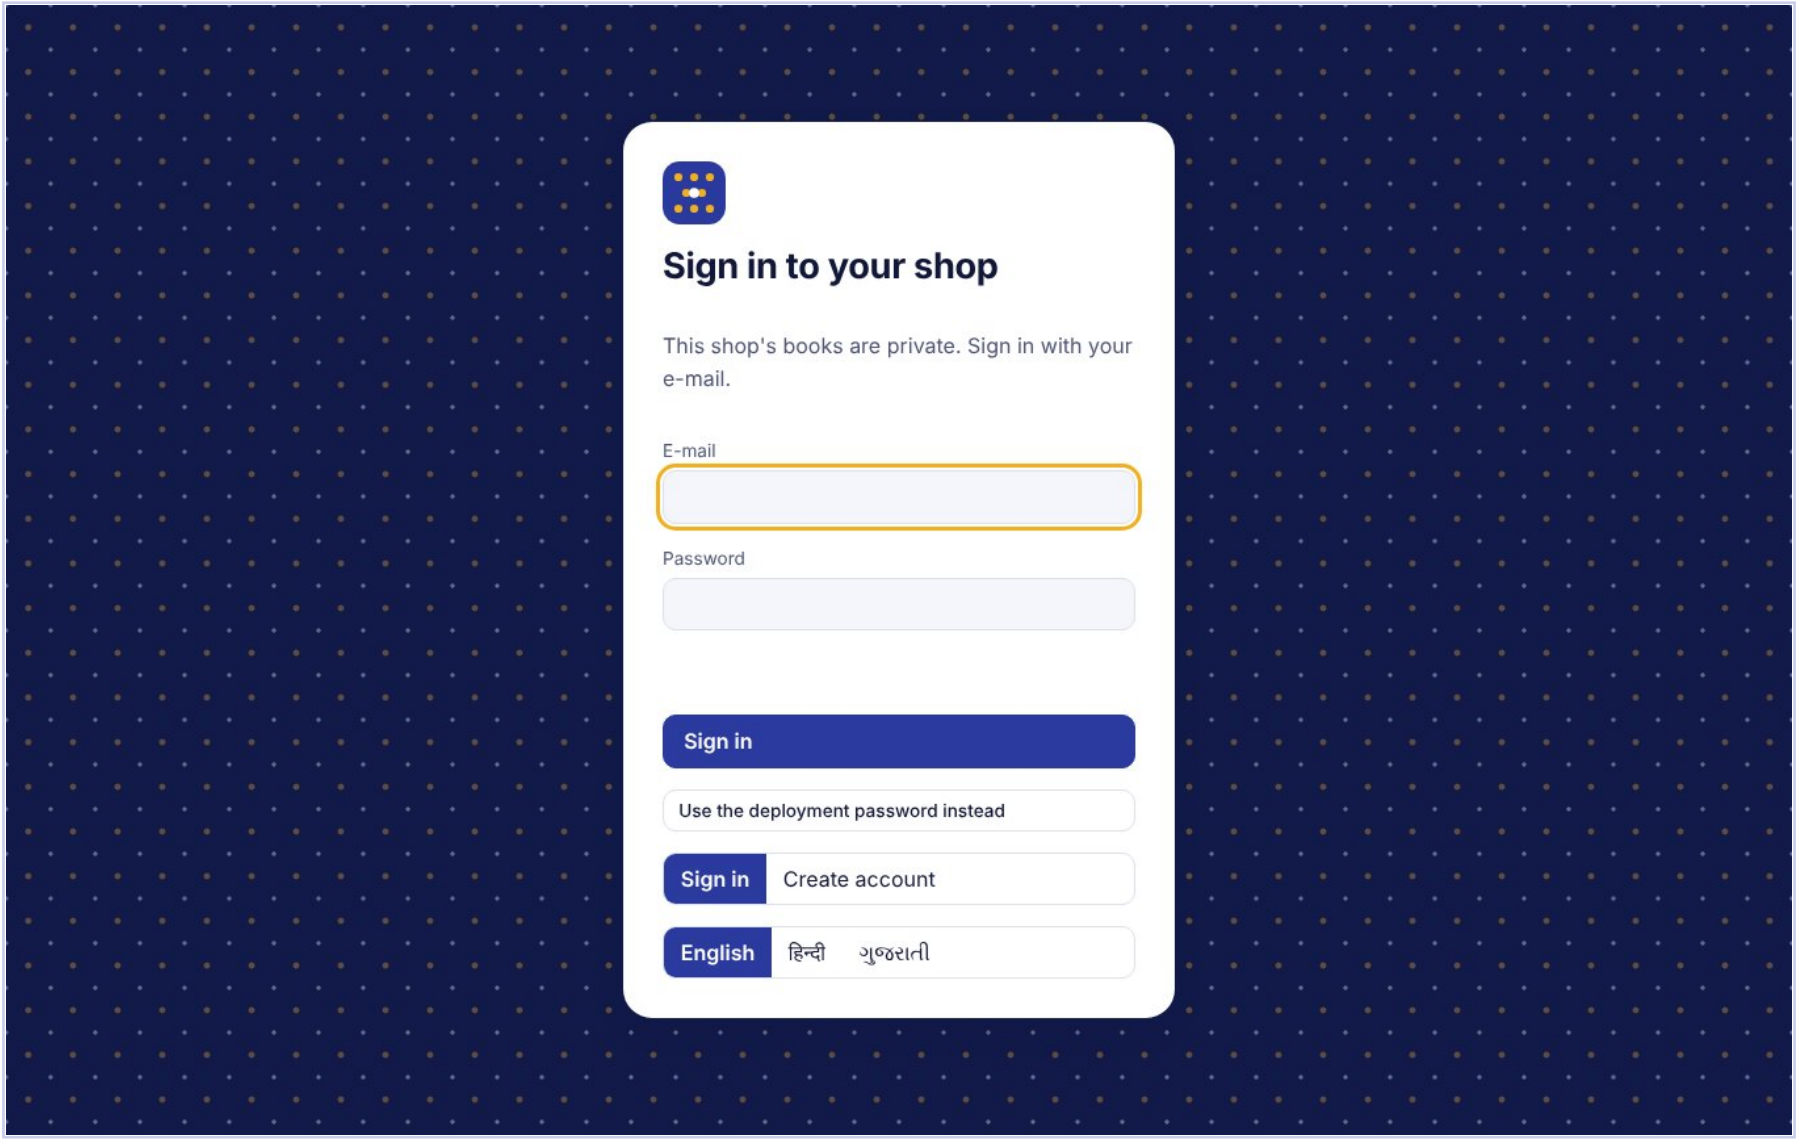

The frontend is plain JavaScript modules, CSS and three HTML pages. There is no build step and no framework, so it runs from any static host or straight from the backend.

Owner app (index.html)	Today, Stock, Money, Forecast, Trust, Be found (with Feedback), Account. Sidebar on a desktop, bottom tab bar on a phone.
Public shop page (shop.html)	What a customer sees: only what the owner published, a trust badge they can verify, and a private rating and comment form.
Counterparty page (party.html)	The private link a person opens to see, dispute or veto what is recorded about them.
Languages	English, Hindi and Gujarati for every screen and warning.
Safety rule	User text is added to the page as text only, never as HTML, so a note cannot inject code.
Where it lives	frontend/ in the repository; the same files are zipped in frontend-pack/livingdoc-frontend-pack.zip.

Figures

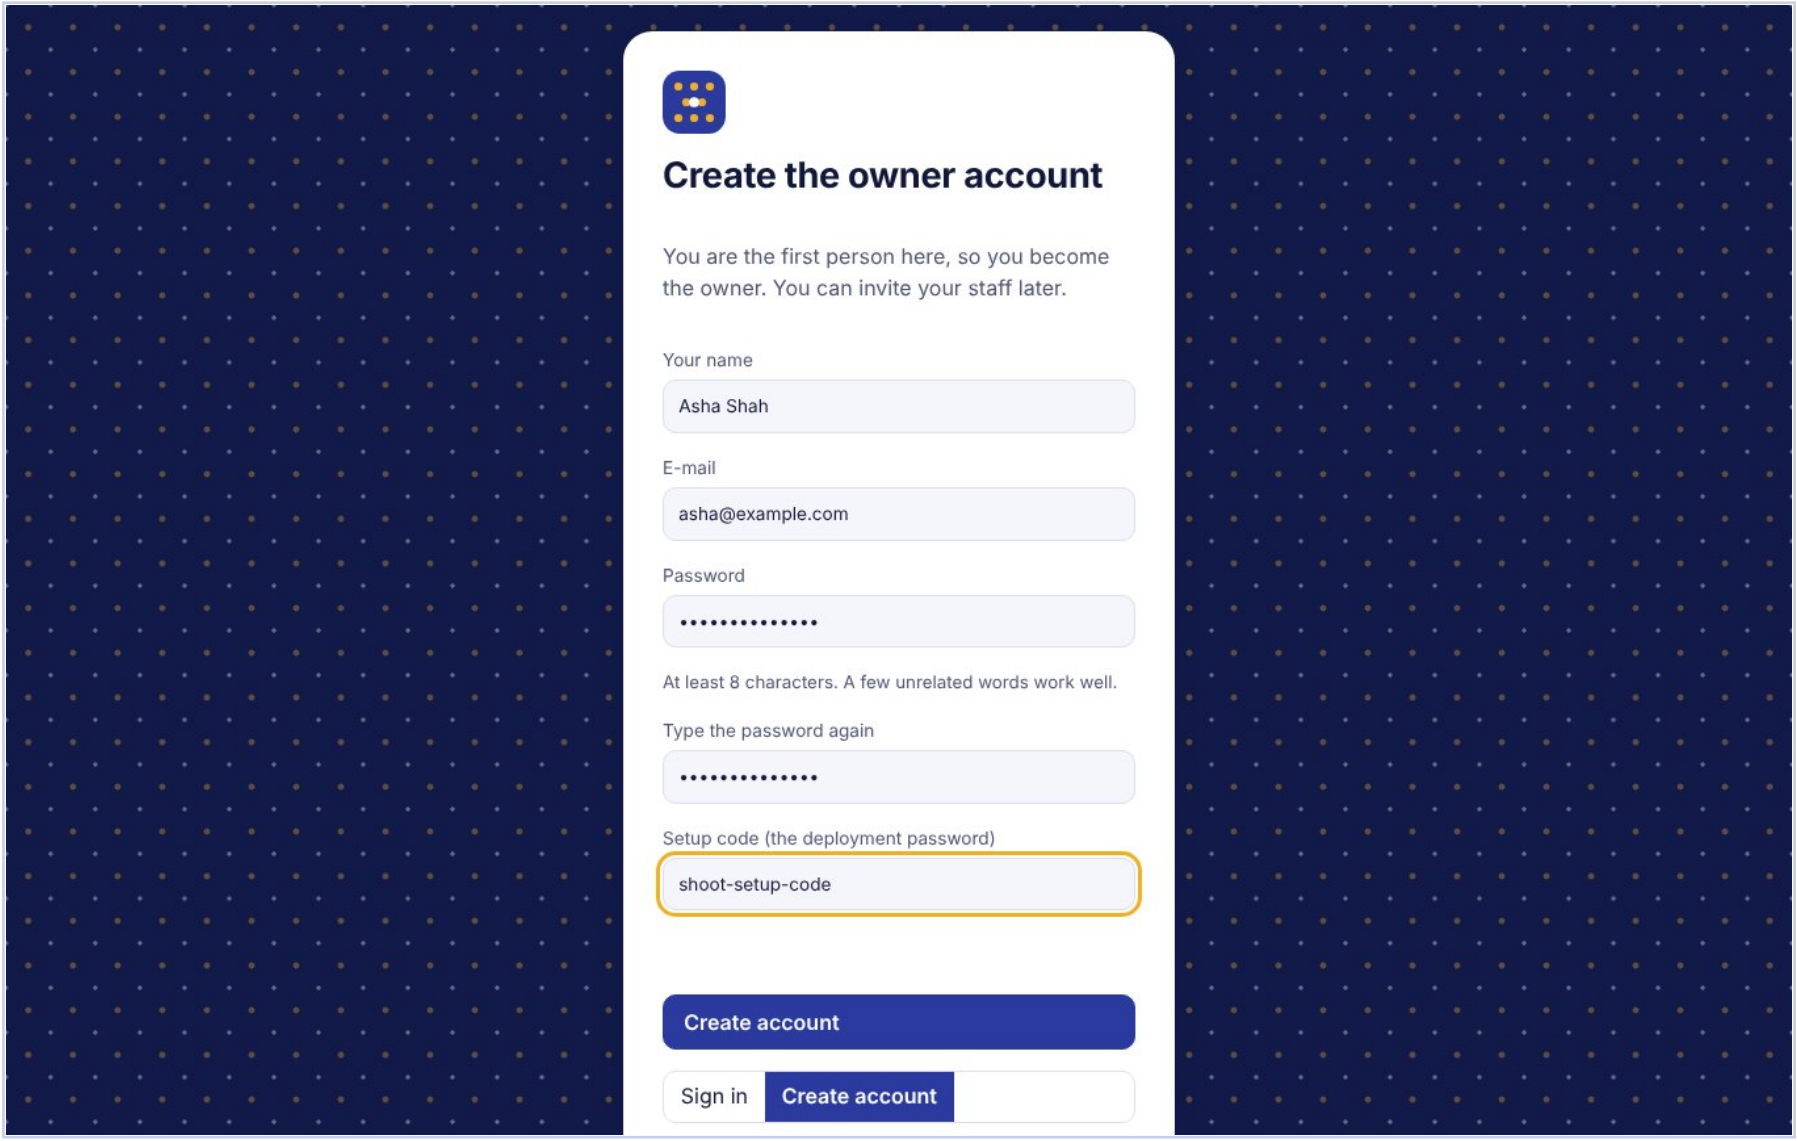

Figure 1: Sign in
Figure 2: Create the owner account
Figure 3: Account, people and invites
Figure 4: Today at the shop
Figure 5: Stock and scanner
Figure 6: Money and promises
Figure 7: Forecast and pricing
Figure 8: Trust ledger
Figure 9: Promise to cash flow
Figure 10: Proof without exposure
Figure 11: Be found: the owner's page builder
Figure 12: The helper only drafts
Figure 13: Feedback
Figure 14: Activity log
Figure 15: Hindi interface
Figure 16: Dark mode
Figure 17: Public shop page (phone)
Figure 18: Checking the signature and leaving a rating
Figure 19: A counterparty's private page (phone)
Figure 20: The app on a phone

Figure 1. Sign in

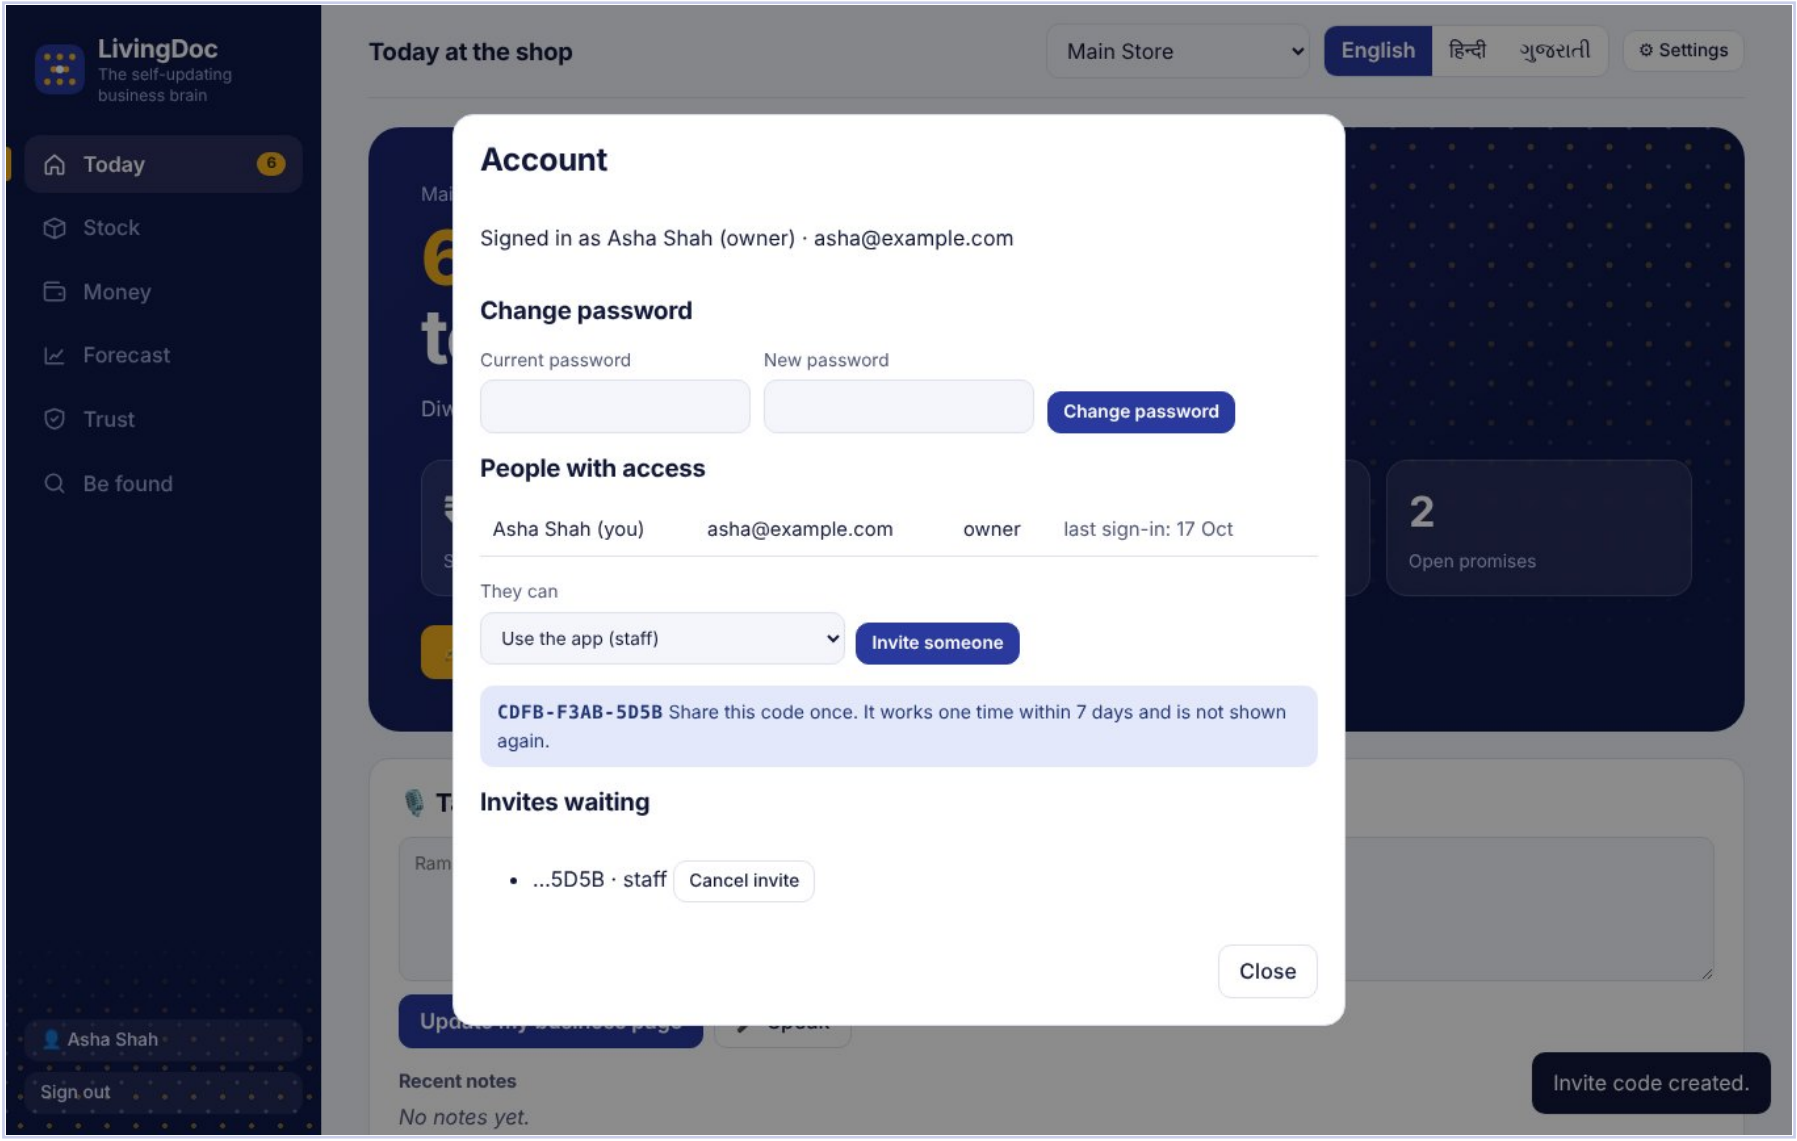

Sign-in screen. The shop's books are private; people sign in with their e-mail. English, Hindi and Gujarati are one tap away.

Figure 2. Create the owner account

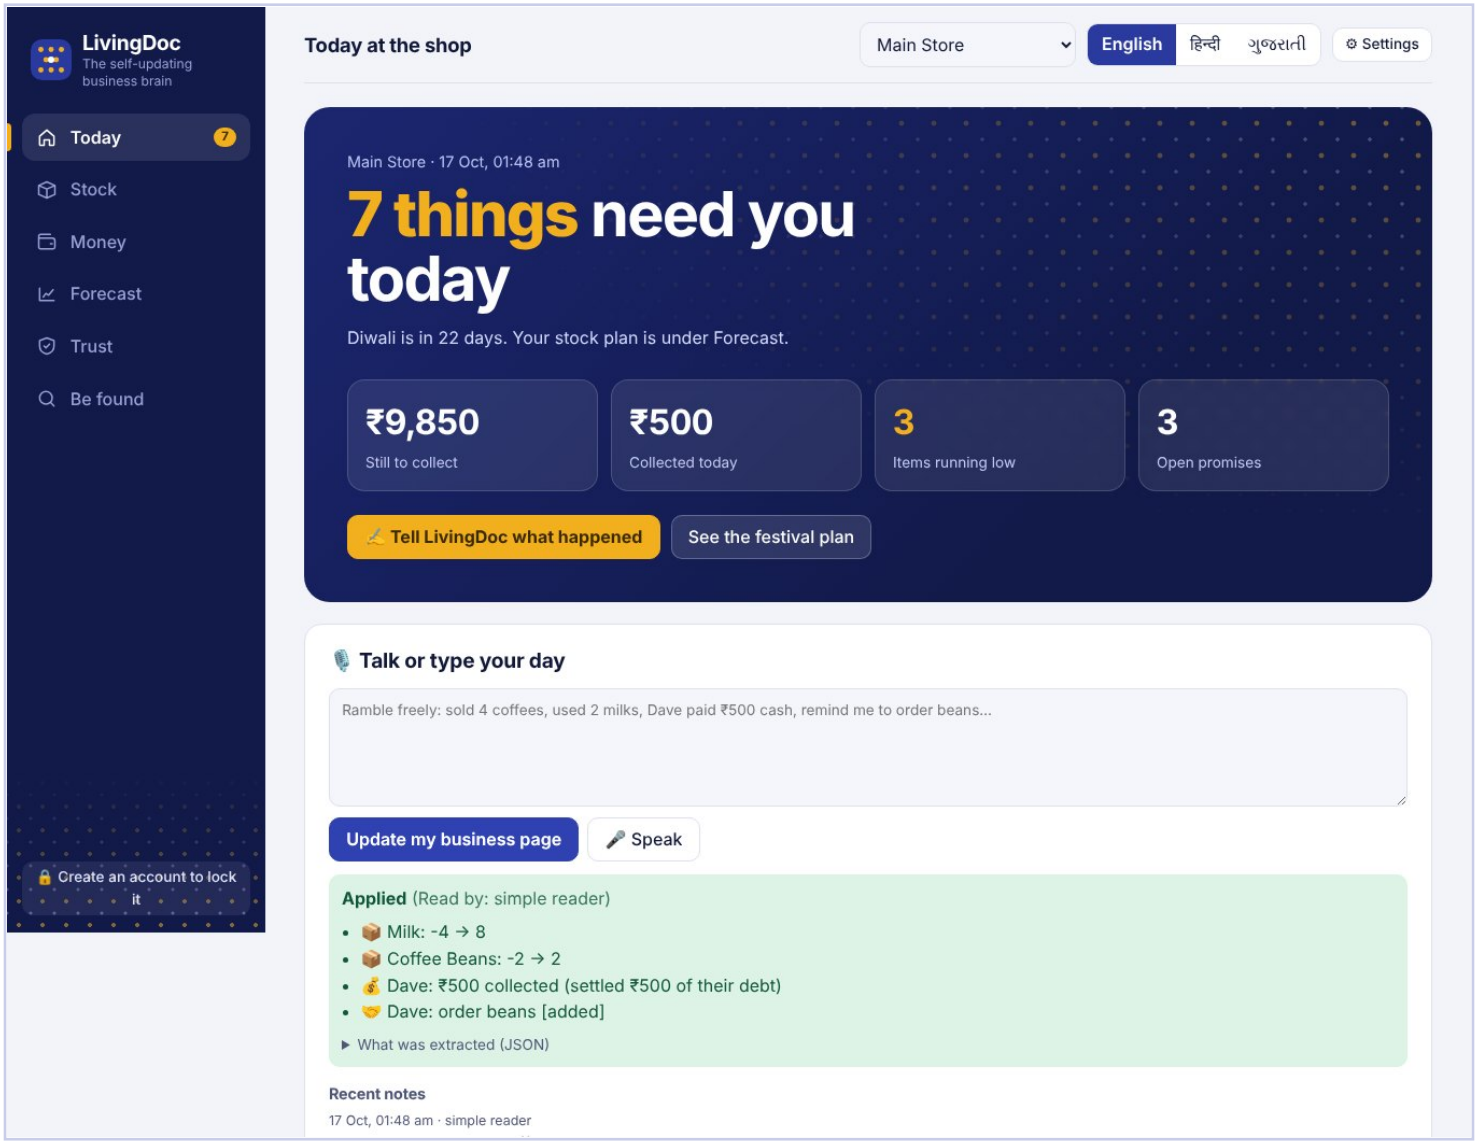

First-run sign-up. The first person becomes the owner; on a public host they must type the deployment password as a setup code so a stranger cannot claim the app.

Figure 3. Account, people and invites

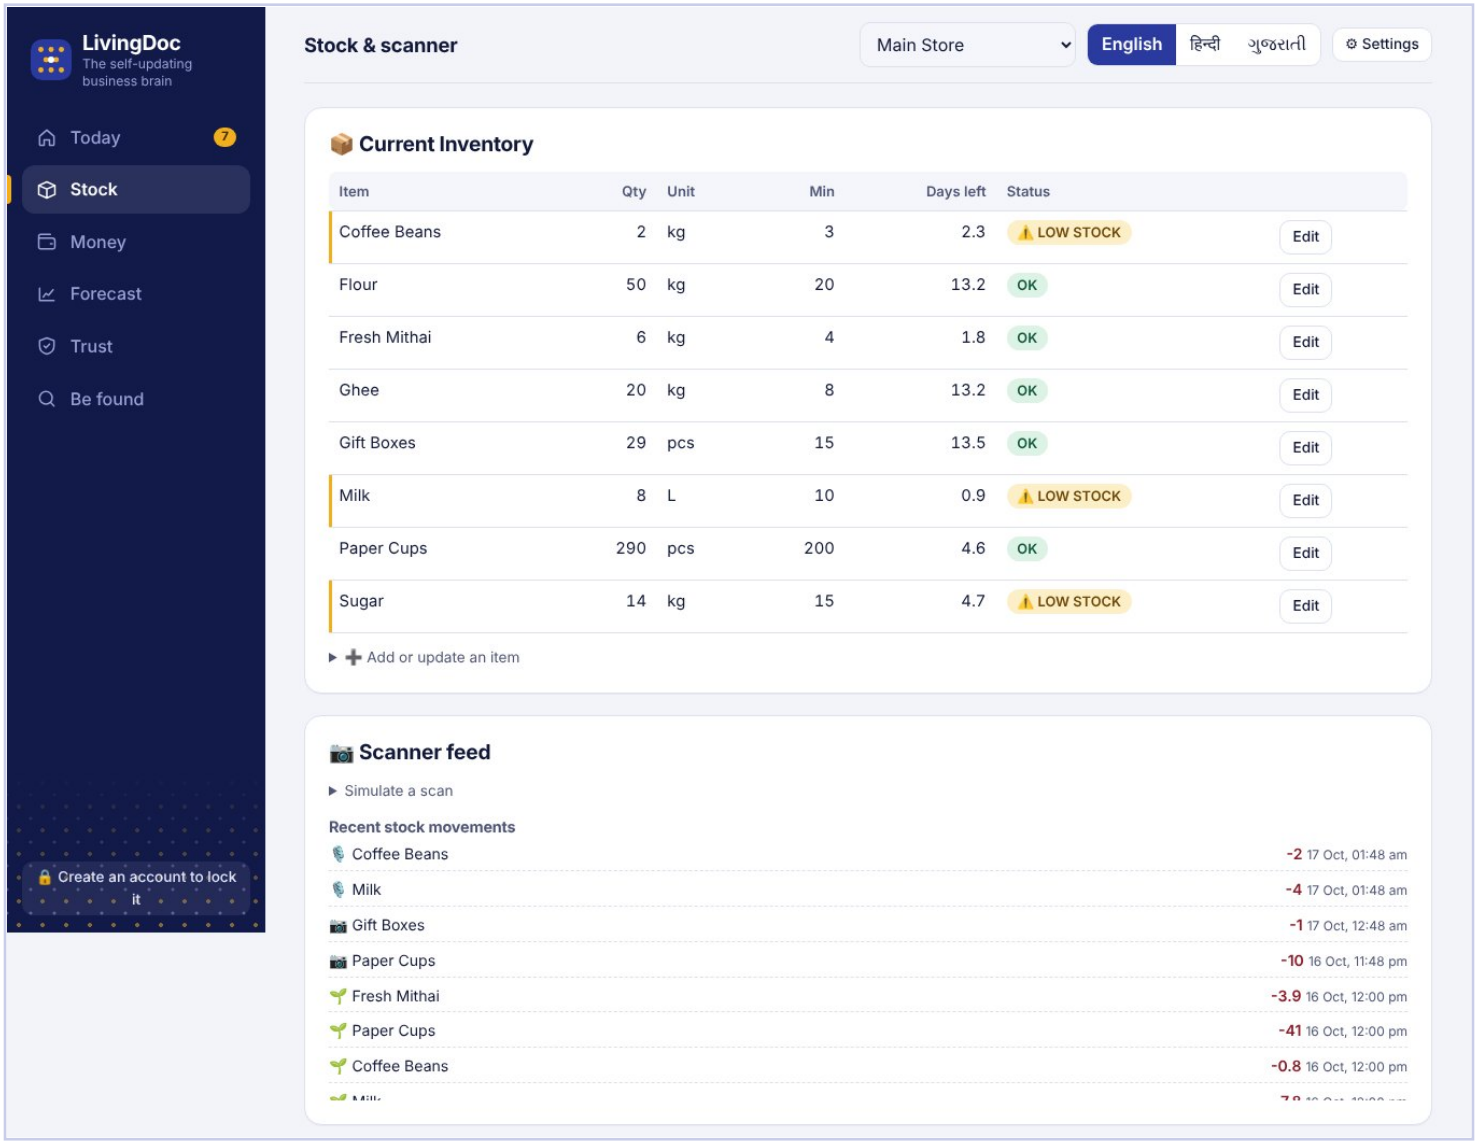

Owners invite staff with single-use codes (valid 7 days) and can remove people. Staff can use the shop but cannot manage people. Passwords are stored only as salted hashes.

Figure 4. Today at the shop

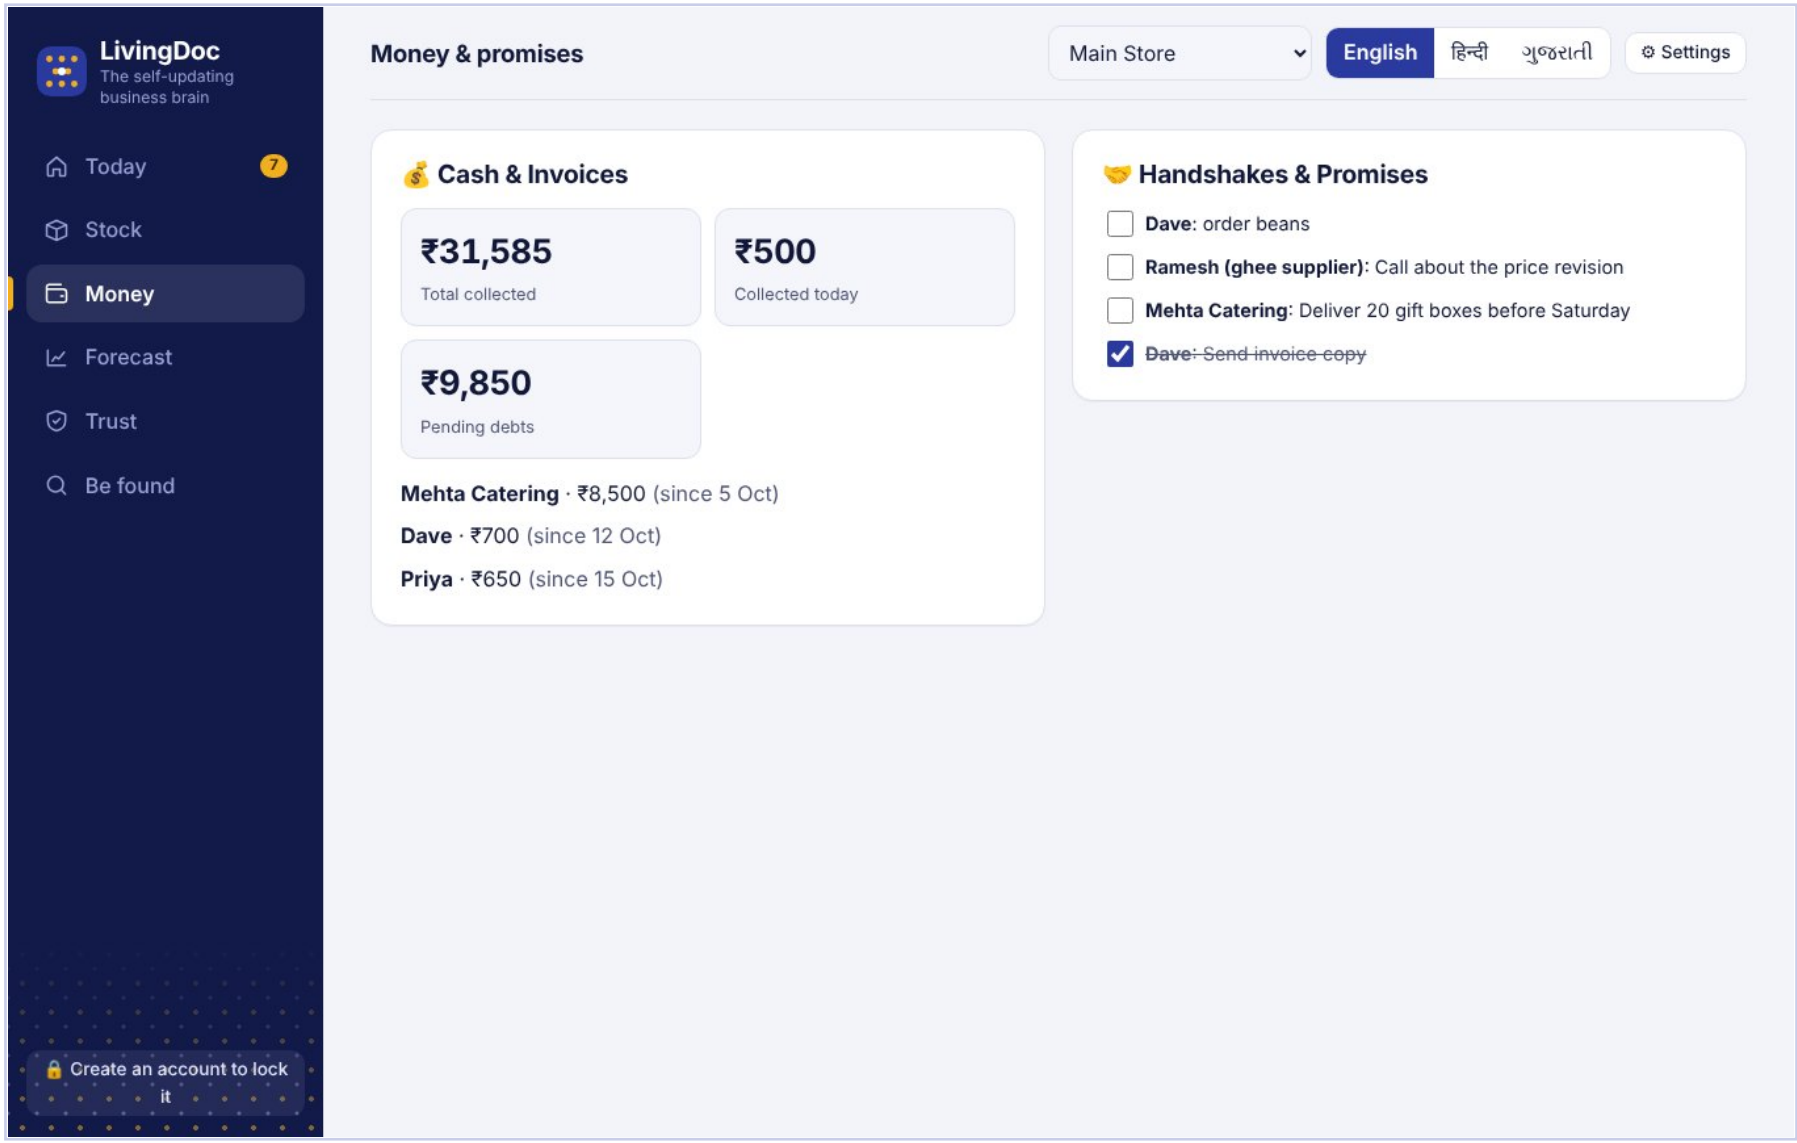

The Today screen: how many things need the owner, four live numbers, and a note box. The owner writes or speaks their day in plain words and the page updates itself.

Figure 5. Stock and scanner

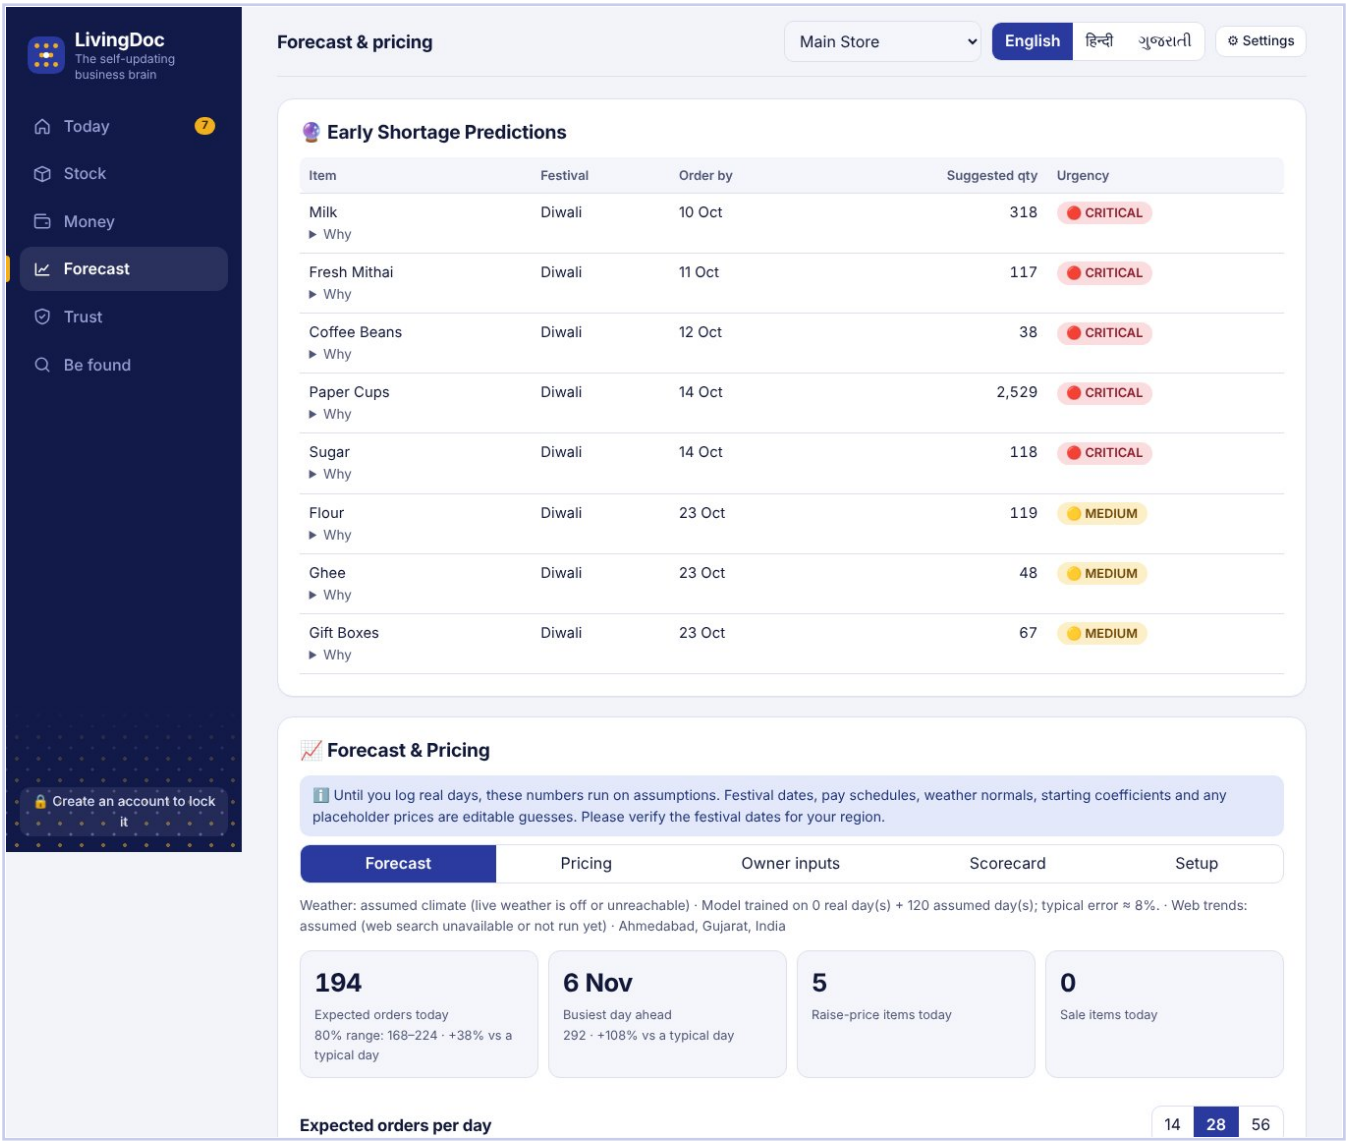

Live stock counts with days left, low-stock alerts, and a scanner feed. Every change is a logged movement, so the numbers can be audited.

Figure 6. Money and promises

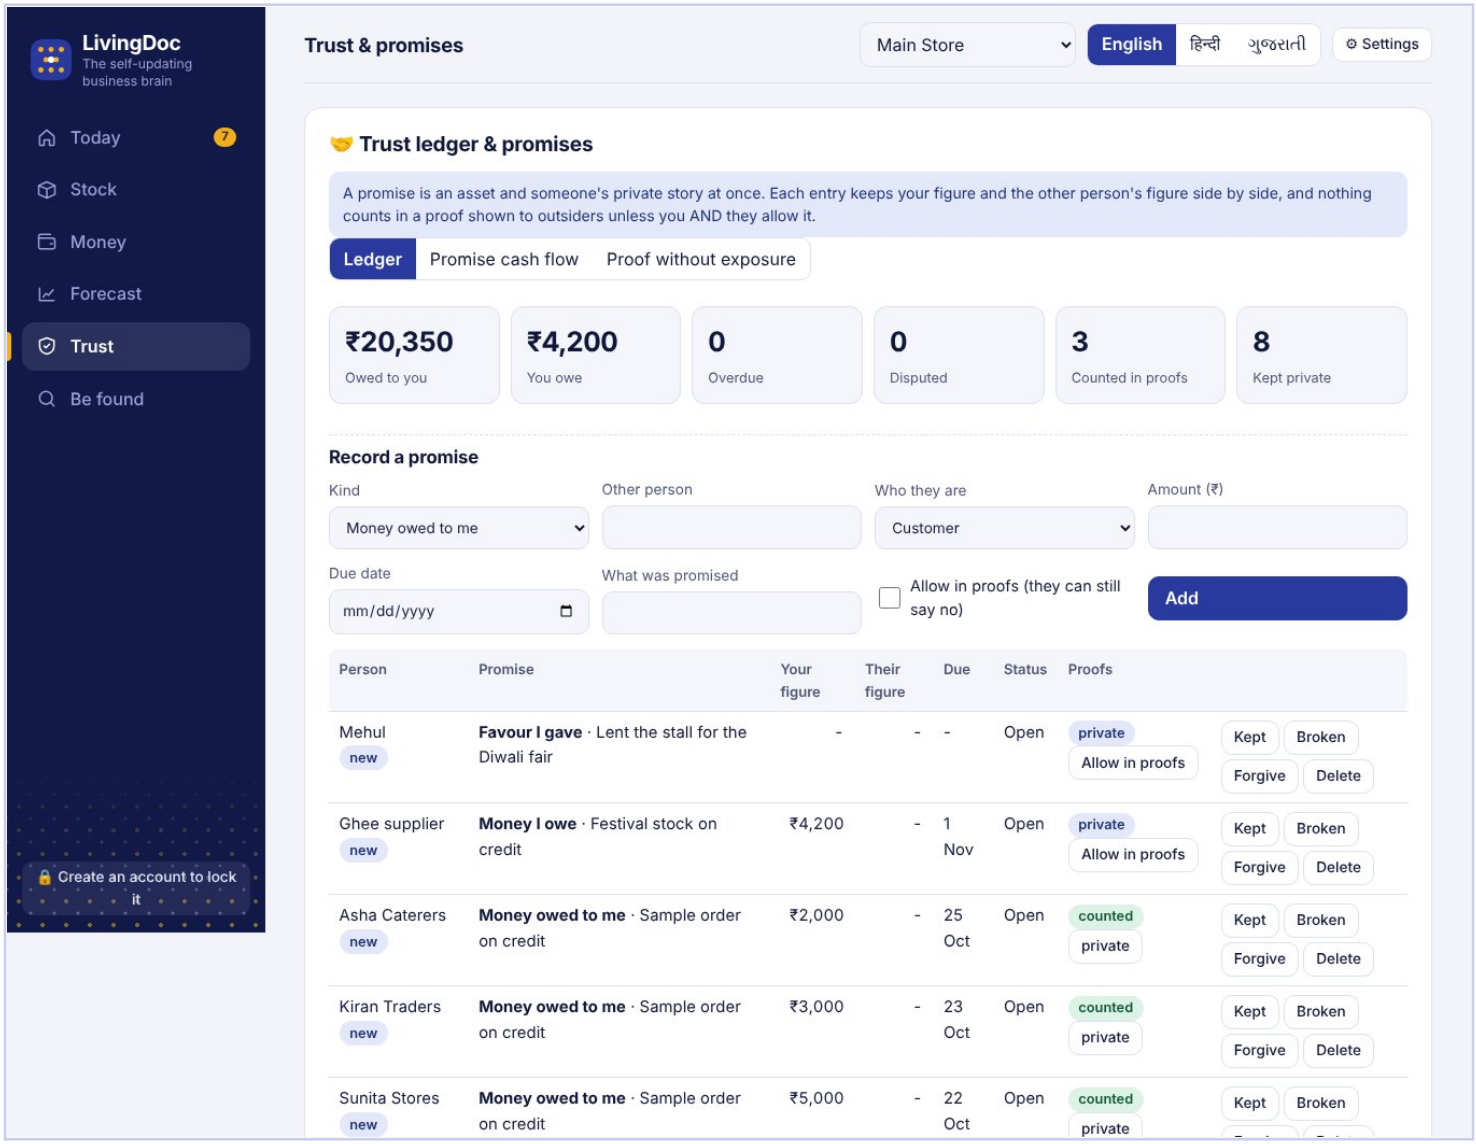

Cash collected, what customers still owe (a payment settles the oldest debt first) and the checklist of promises created from notes.

Figure 7. Forecast and pricing

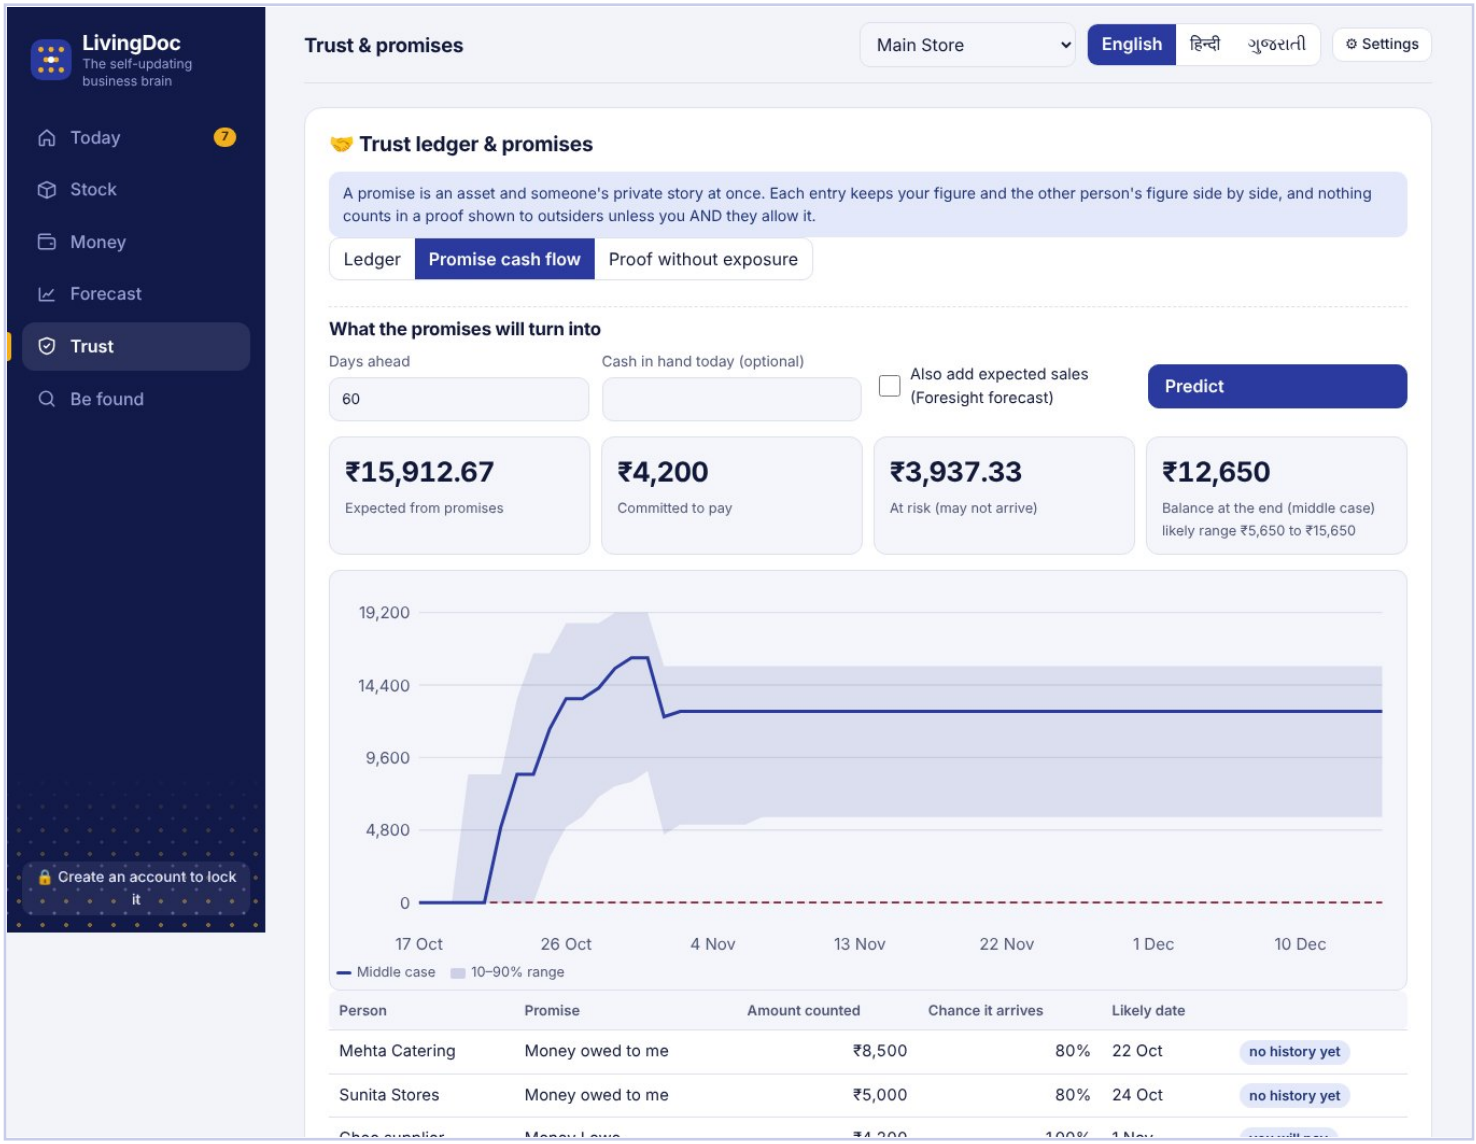

Demand forecast with 50% and 80% ranges, never a single number. Assumptions are labelled, and the price plan (raise / sale / hold) is capped by real stock.

Figure 8. Trust ledger

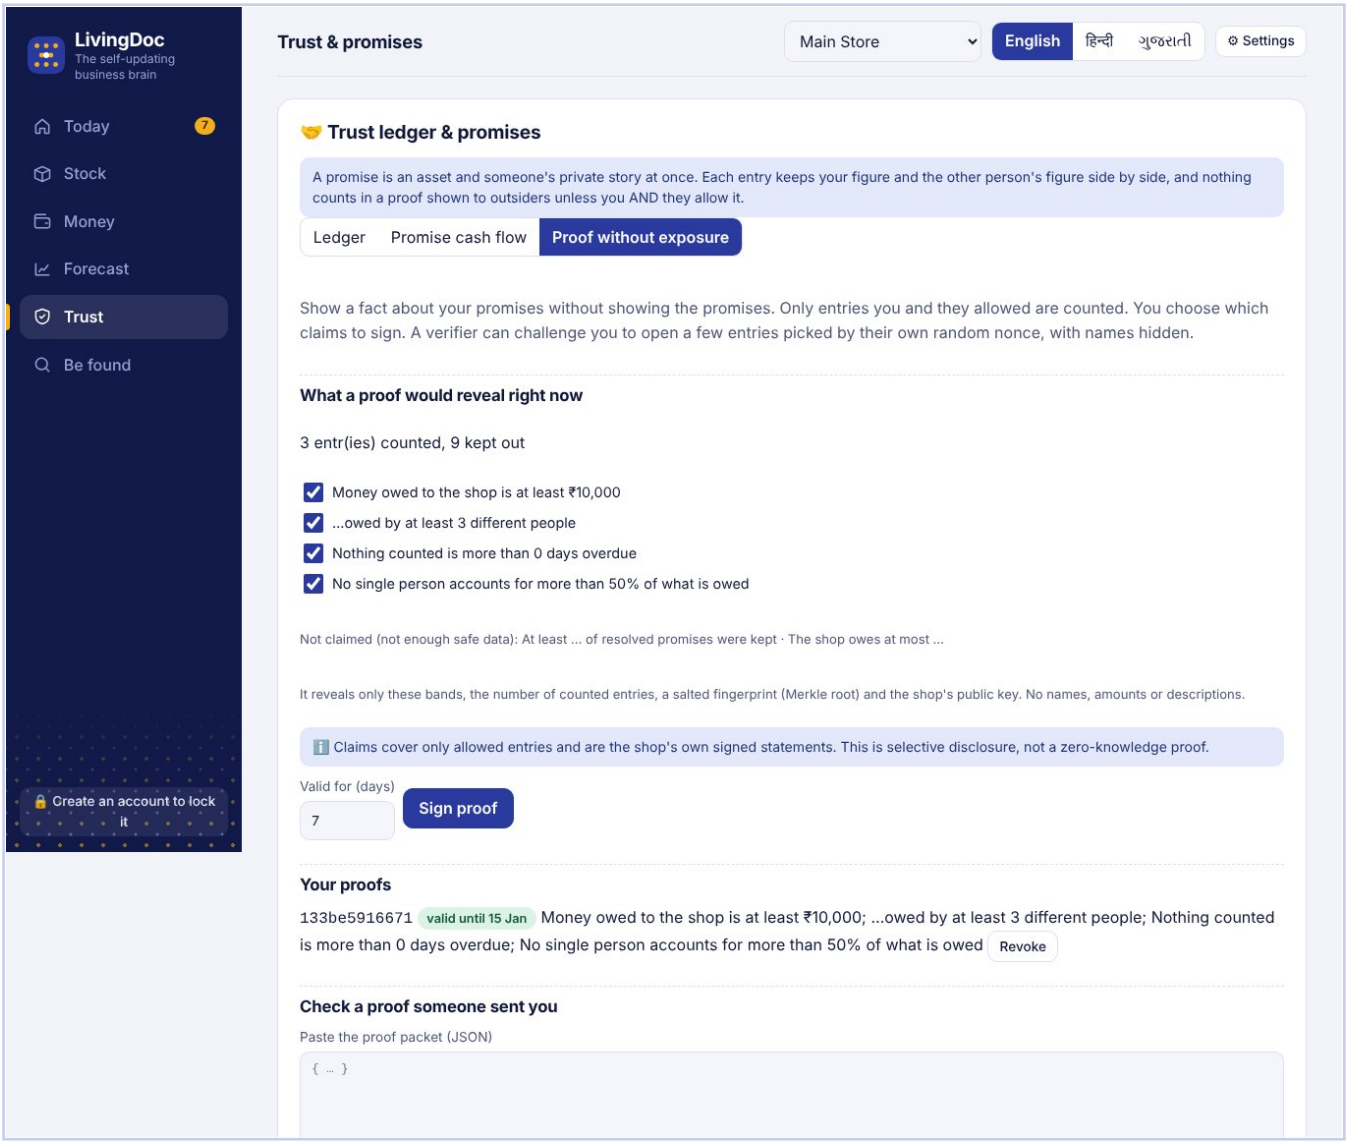

Every promise keeps both sides' figures: money owed, money we owe, favours and someone's word. Entries are private unless the owner and the other person allow them to count.

Figure 9. Promise to cash flow

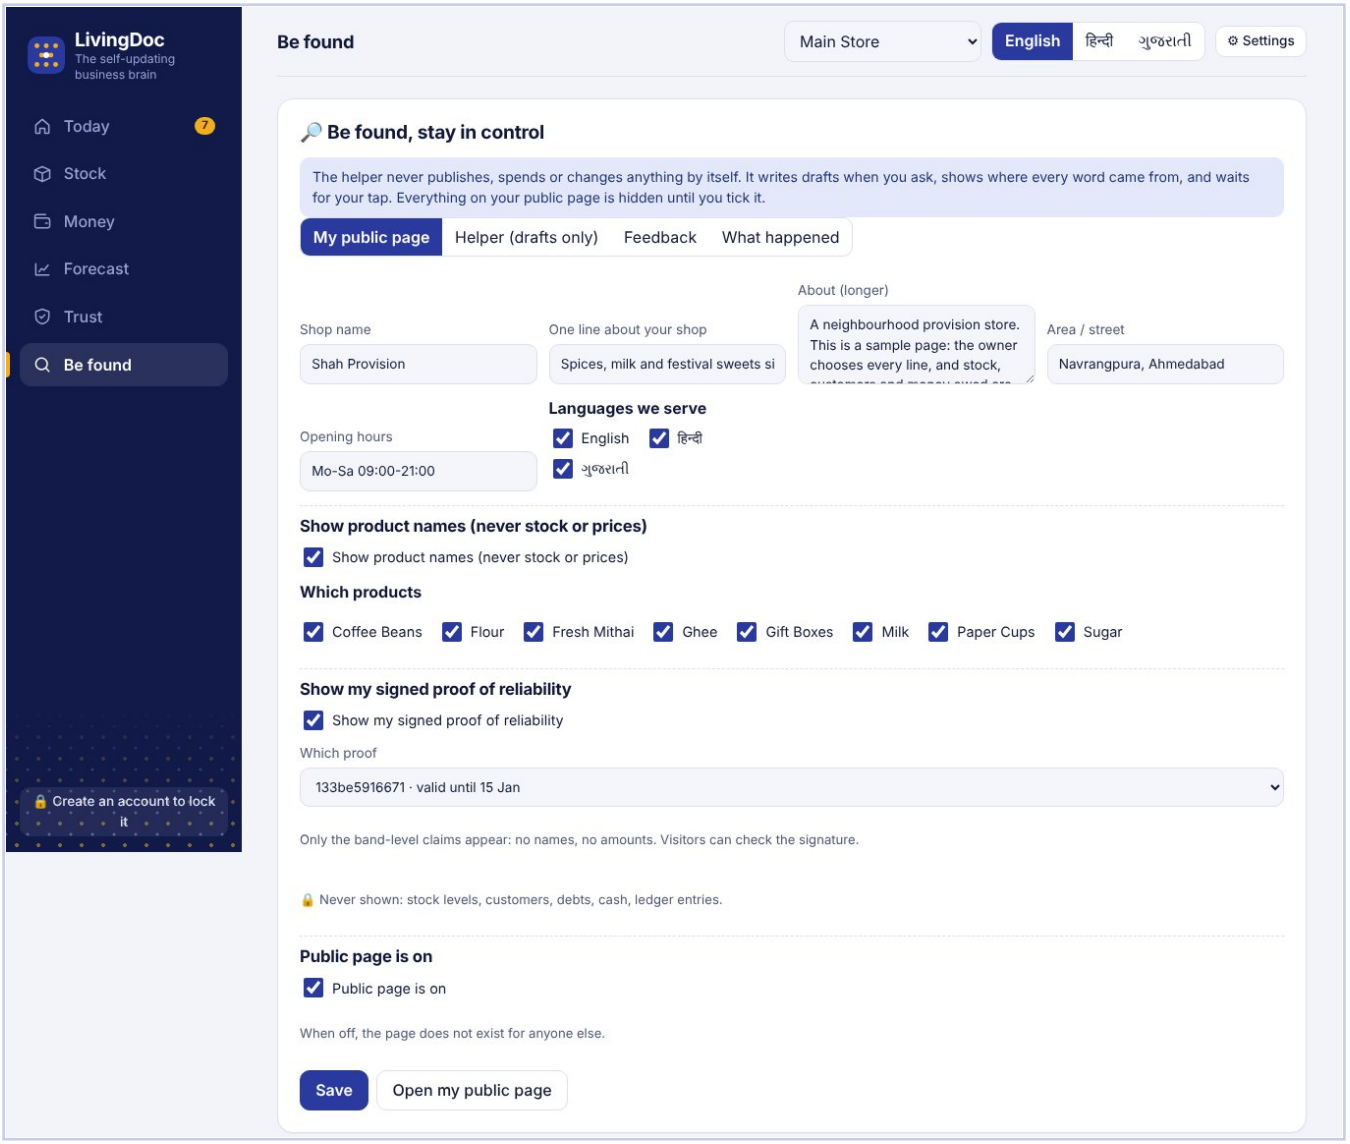

Open money promises become a seeded cash-flow forecast with a 10/50/90% range of when the money actually arrives, using each person's track record.

Figure 10. Proof without exposure

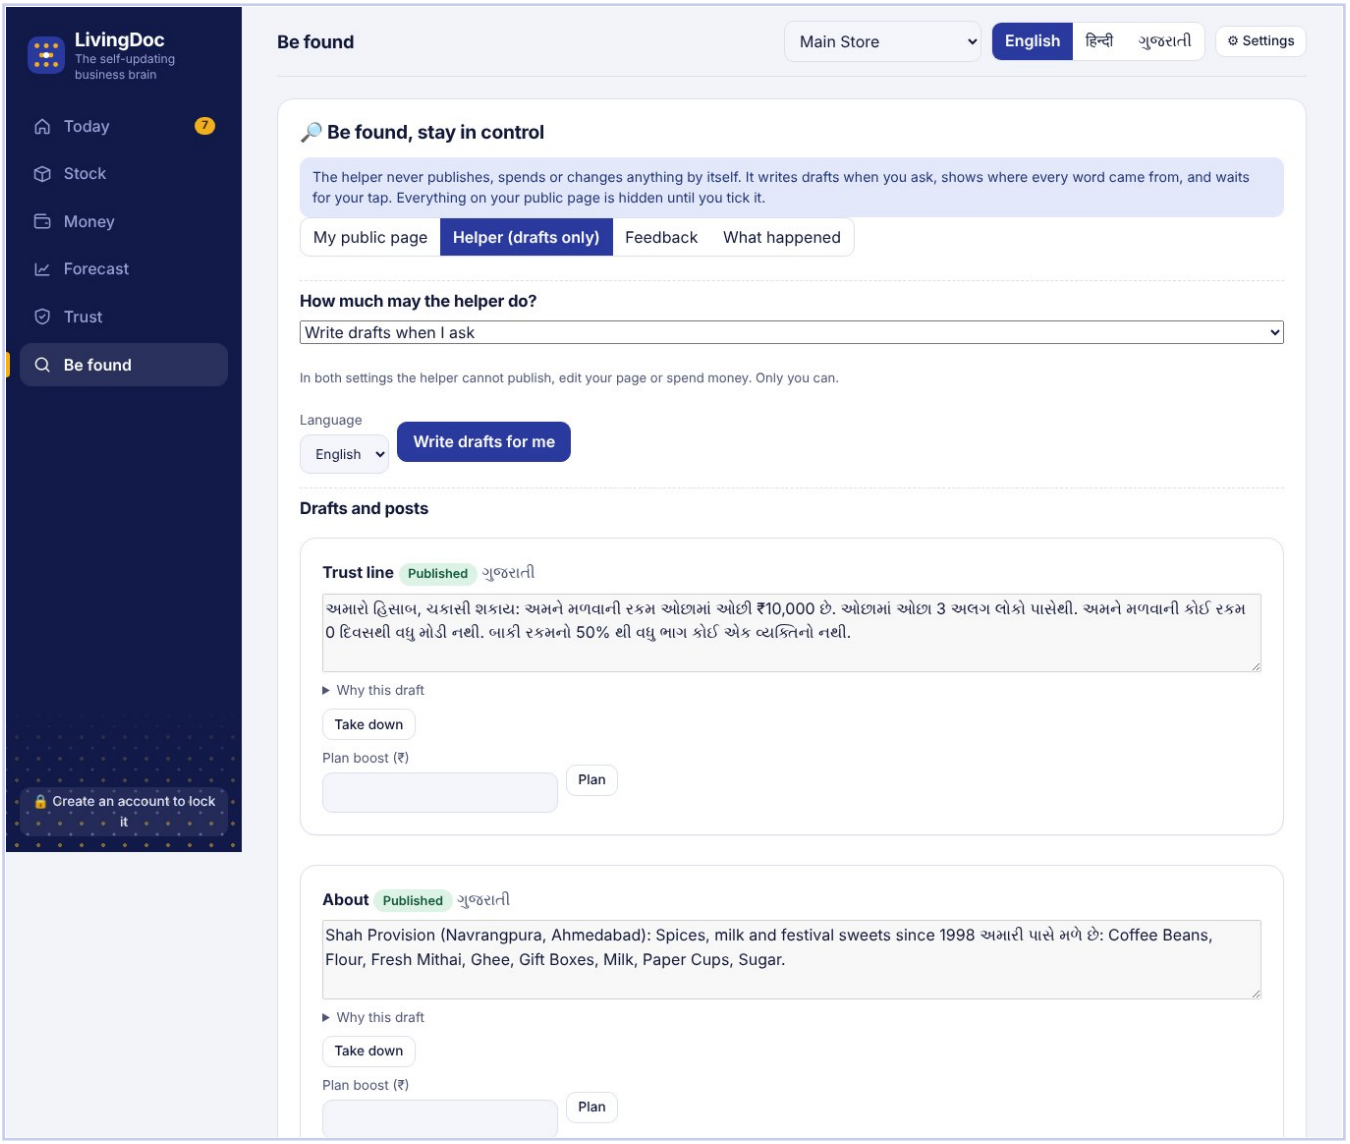

The shop signs a few band-level claims (for example 'owed at least Rs 5,000 by at least 2 people'). A verifier checks the signature; names and amounts never leave.

Figure 11. Be found: the owner's page builder

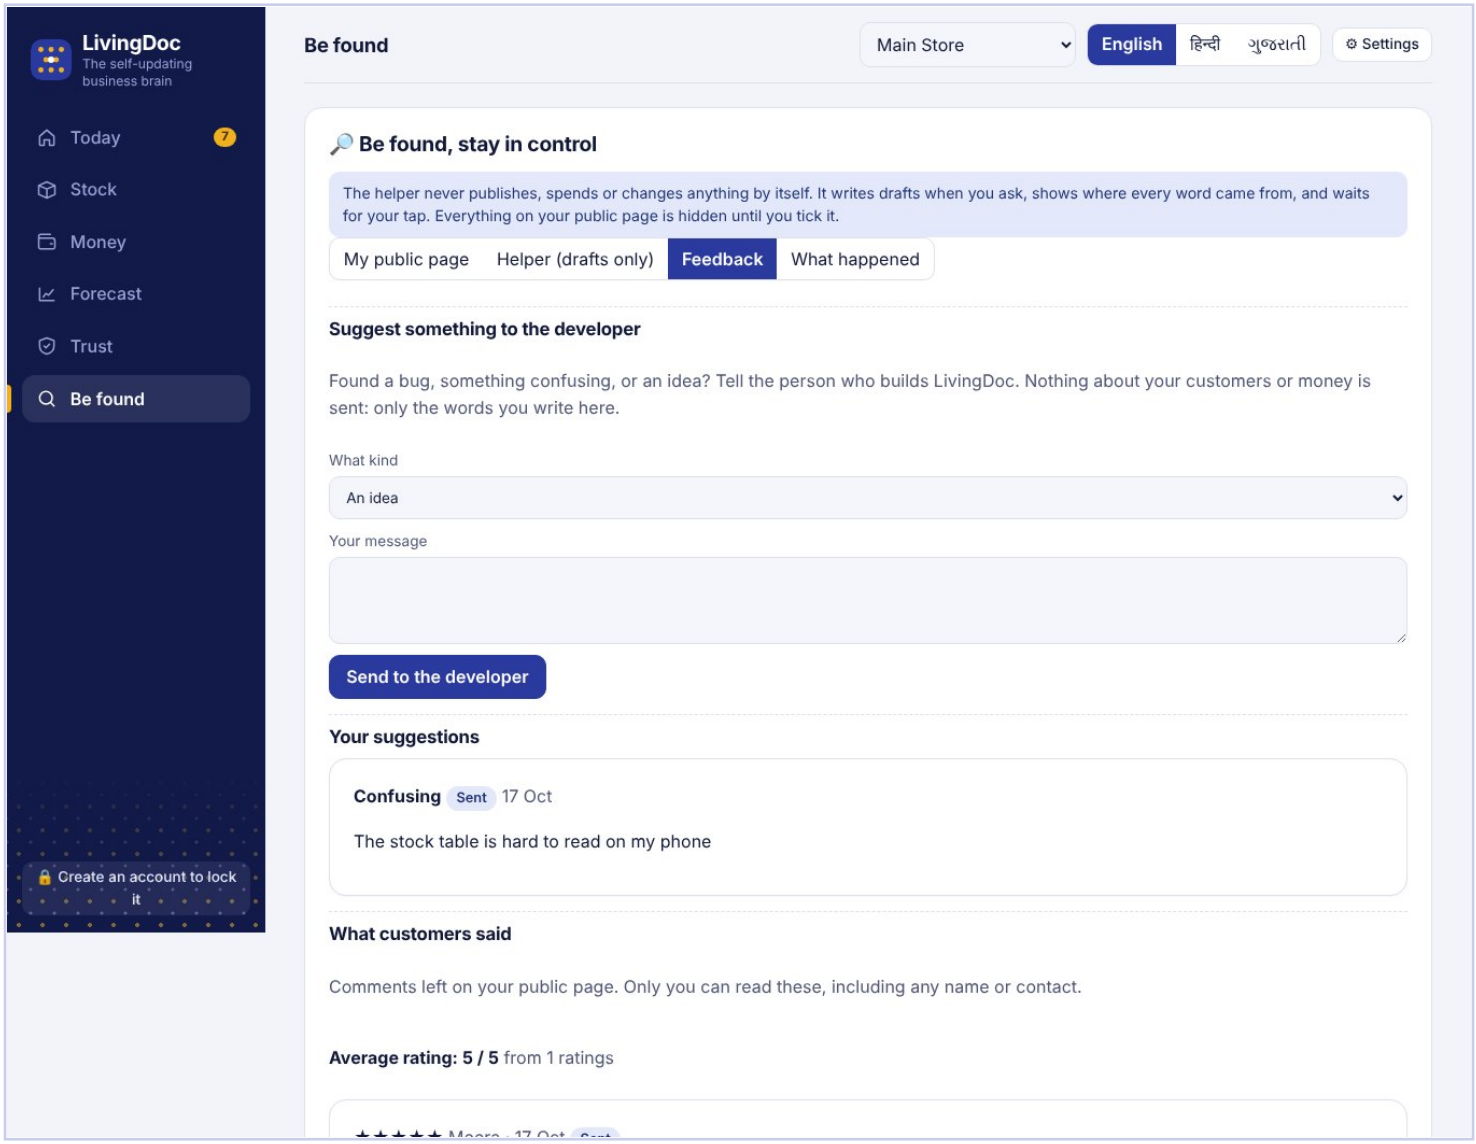

Nothing is public until the owner ticks it, field by field. Stock, customers, debts and cash are never shown.

Figure 12. The helper only drafts

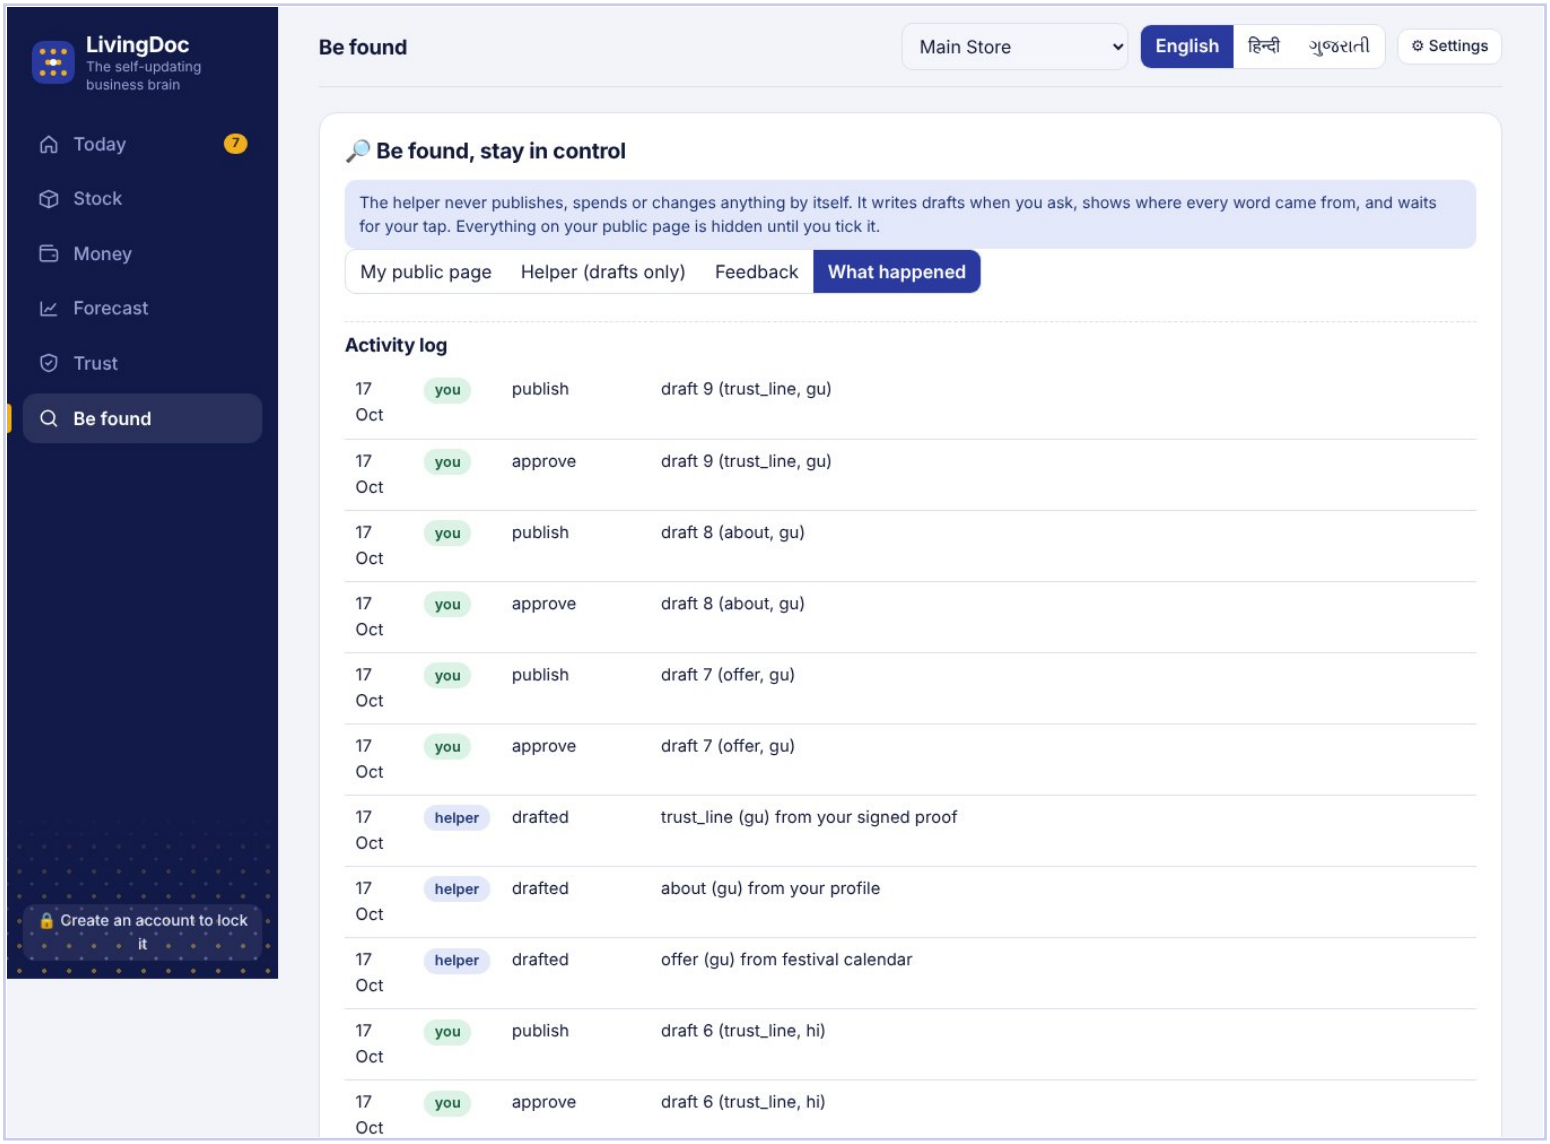

The AI helper writes drafts when asked, shows what each was built from and that it invented nothing, then waits. It cannot publish, edit the page or spend; the budget cap covers planned spend only.

Figure 13. Feedback

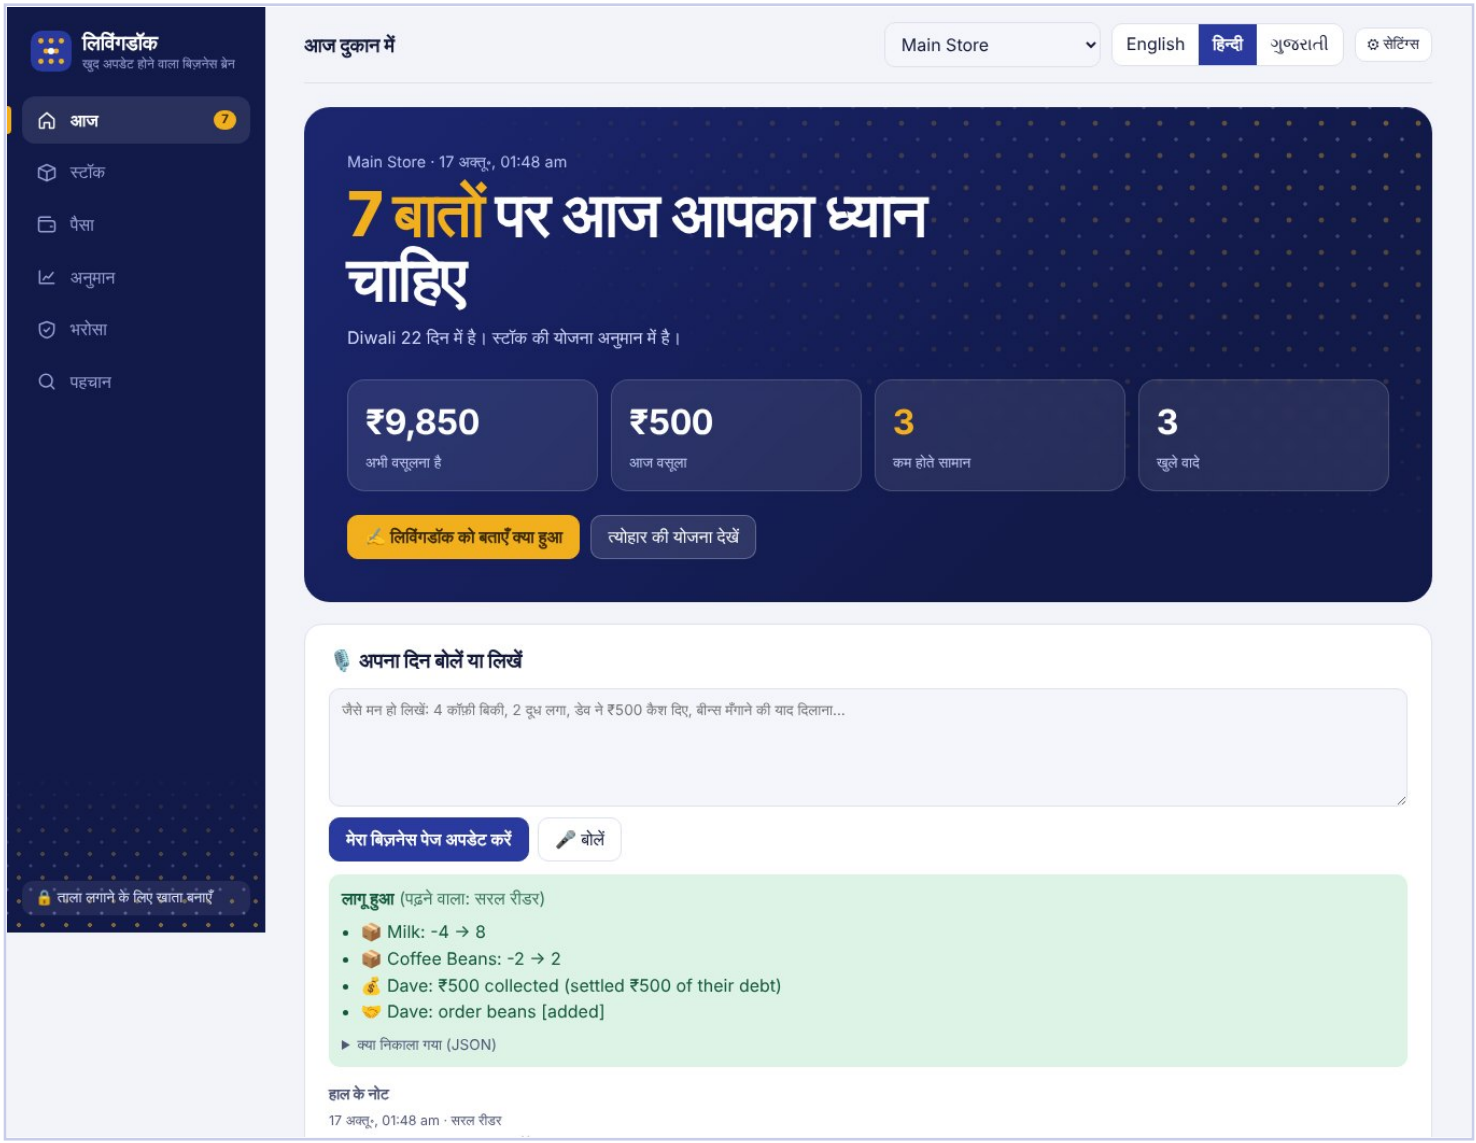

Owners send suggestions to the developer from inside the app and see their status. Customer ratings and comments are visible only to the owner.

Figure 14. Activity log

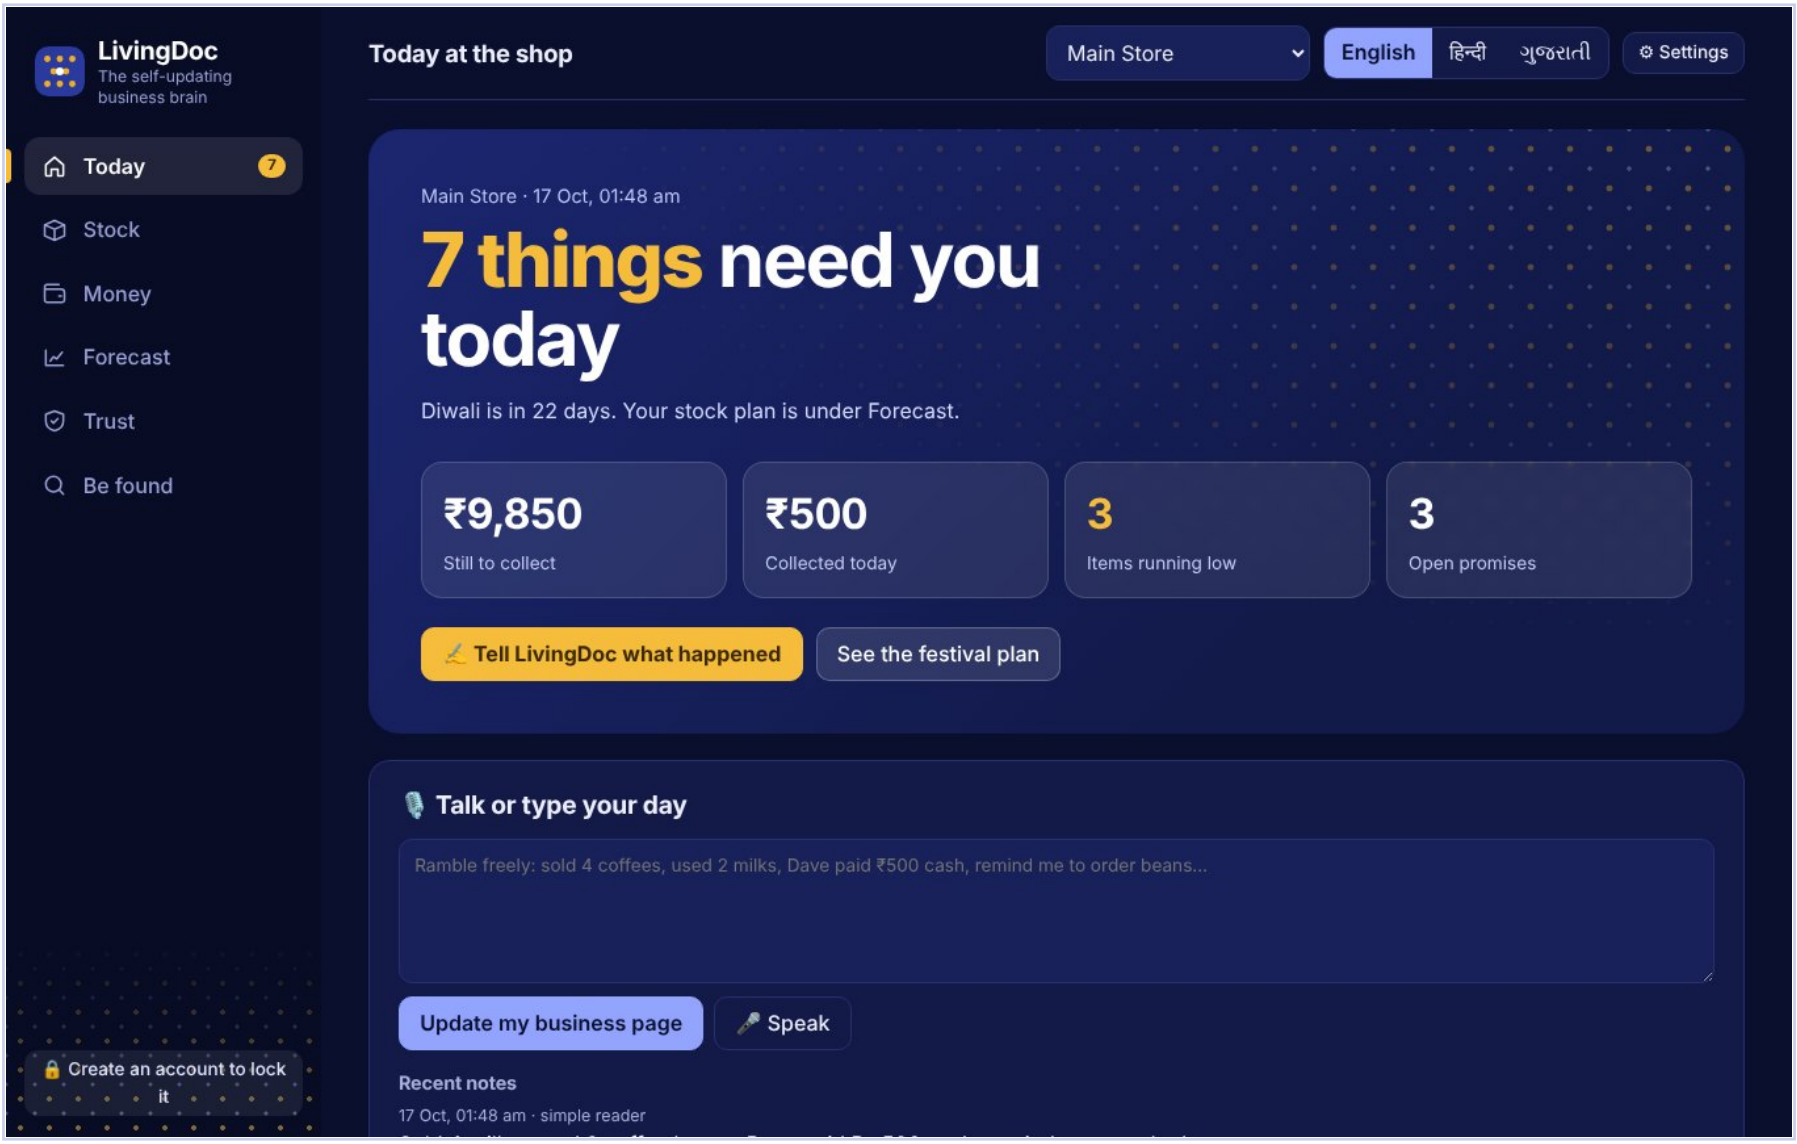

Everything the helper and the owner did is logged, so the owner can always see who changed what.

Figure 15. Hindi interface

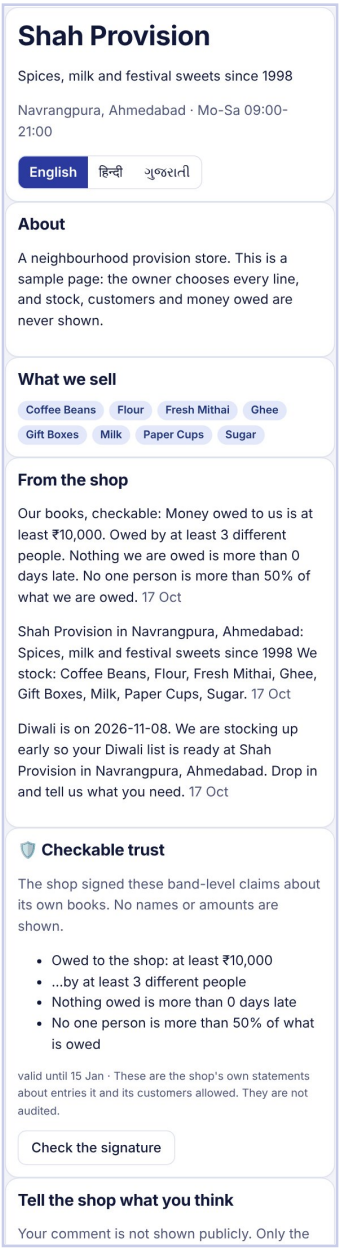

The whole interface, warnings and tables are available in English, Hindi and Gujarati.

Figure 16. Dark mode

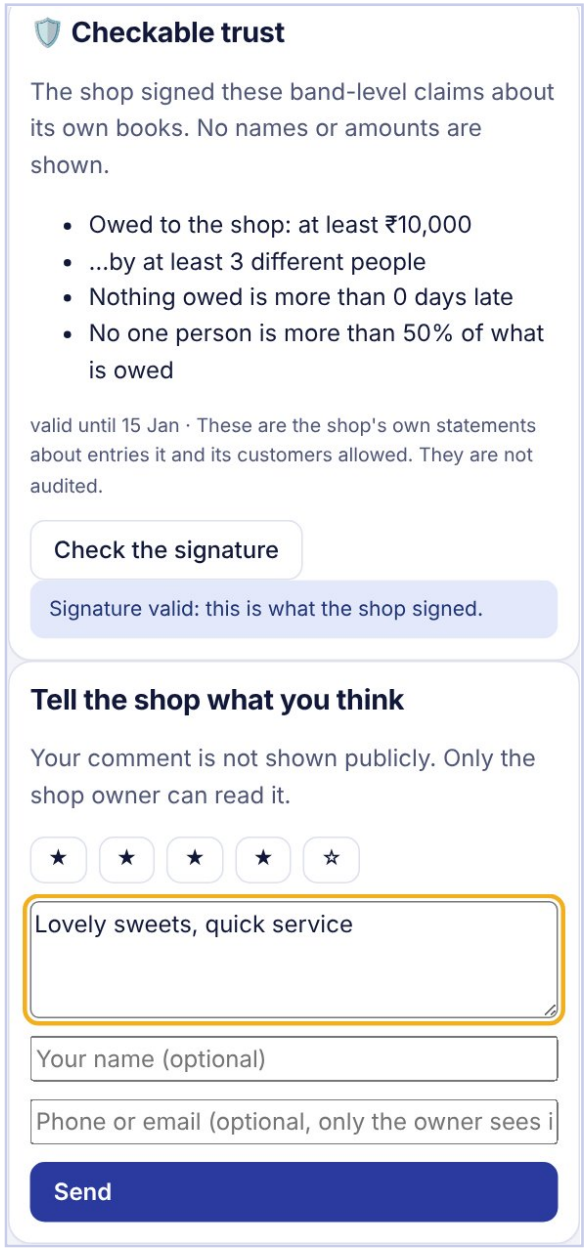

Light and dark themes follow the device setting.

Figure 17. Public shop page (phone)

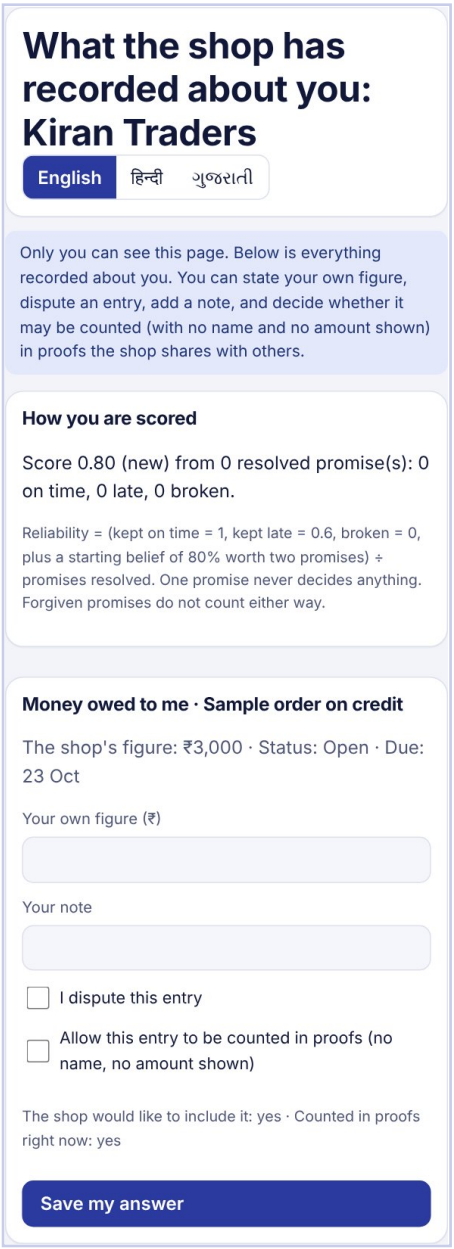

What a customer sees: only what the owner published, in their language, with a trust badge they can verify.

Figure 18. Checking the signature and leaving a rating

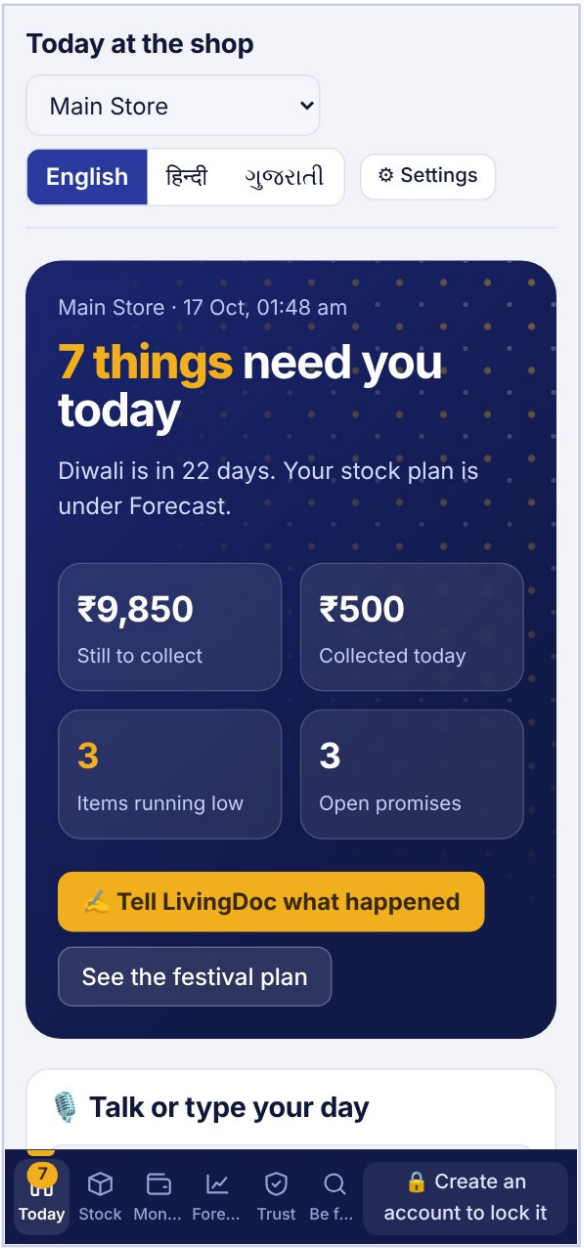

A visitor taps 'Check the signature' and gets a valid/invalid answer, then can rate the shop. Their comment is private to the owner.

Figure 19. A counterparty's private page (phone)

The other person opens their own link to see only what is recorded about them, and can enter their own figure, dispute it, or veto its use in proofs.

Figure 20. The app on a phone

On a phone the sections move to a bottom tab bar, with no sideways scrolling.
